

## Water crystal test Hado Life

Tested devices: Bubble, Cocoon & Kloud test setup:

- All devices have been tested three times at intervals of about one week
- For this purpose, a standard sample/reference sample was tested
- Each sample series comprised 50 drops (approx. 1ml), which were dropped into each of the 50 Petri dishes
- A series of samples were frozen between -25°C and -28°C for several hours and then examined and photographed in a brightfield reflected light microscope at 200x magnification at -5°C. (Canon EOS5/45 megapixel)
- Used water: Reverse osmosis water
- Evaluation procedure: The four best results/images per sample series were always used.
- **Standard sample:** Three test series; water sample (200ml); each 10min next to a switched-on WLAN router, then sample collection.

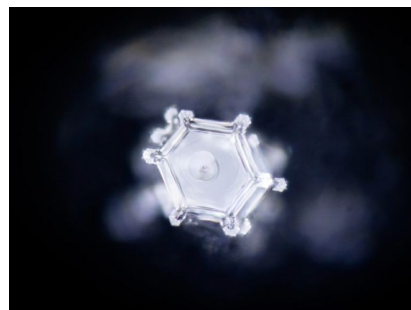

- **Bubble:** Three test series; water sample with bubble "hung around" (200ml); 10min next to a WLAN router that is switched on, then sample collection.

- **Cocoon:** Three test series; Cards *E-smog*, *sleep well*, *hawaii harmony* inserted into Cocoon; water sample (200ml) placed on Cocoon, which is located directly next to the WLAN router that is switched on; sample collection after 10 minutes.

- **Kloud:** running on P5 / full intensity; water sample (200ml) placed on folded KLOUD for 15min; then sample collection.

Based on the findings of Dr. Masaru Emoto, the state of order, which is reflected by recognizable harmonic structures in frozen water, is another quality characteristic of water. It can be assumed that the state of order in water exerts a significant influence on its environment and is therefore an important factor in the health of all life forms present.

Dr. Masaru Emoto achieved great fame with his book "Die Botschaft des Wasser" / "Messages from Water". His work has been translated into 47 languages
